

GitHub + DORA Fact Sheet

1. What is DORA?

The Digital Operational Resilience Act (“DORA”) is an EU regulation that standardizes how financial services industry (“FSI”) entities report cybersecurity incidents, test their digital operational resilience, and manage risk across the EU financial services sector. DORA applies to FSI entities operating in the European Union. It also requires regulatory oversight of designated critical information and communication technology (“ICT”) third-party service providers.

2. When does DORA take effect?

DORA takes effect on January 17, 2025.

3. What is the purpose of DORA?

DORA seeks to enhance the resilience and stability of the EU financial sector by ensuring that FSI entities have in place effective measures to manage and mitigate operational risks, including cyber risks. It aims to protect consumers, investors, and the wider FSI system from the potentially severe consequences of major disruptions or failures within the sector.

4. How does DORA apply to GitHub’s customers?

DORA applies to FSI entities operating in the European Union, including banks, credit institutions, investment firms, insurance companies, payment institutions, and e-money institutions.

FSI entities are expected to manage ICT third-party risk as part of their risk management framework, adopt a policy on using ICT services for critical or important functions, and maintain a register of information on all contractual arrangements with ICT third-party service providers.

5. How will GitHub assist customers with DORA compliance?

GitHub is DORA-ready, so our customers can be too.

In addition to rules for risk management, incident reporting, and operational resilience testing, DORA introduces specific requirements for the contractual arrangements between certain third-party service providers and FSI entities. Accordingly, GitHub has prepared contractual supplements that align with the relevant tiered requirements under DORA.

Talk to us about how GitHub’s suite of products, including [GitHub Enterprise Cloud with data residency](#) and [GitHub Advanced Security](#), can help your organization align with DORA

requirements by reaching out to your account manager. Our team is here to help you evaluate which GitHub products best align with your organization's needs for DORA compliance.

Note: Our belief is that GitHub Copilot would not fall within the scope of critical or important functions under DORA as the way it is typically used would not materially impact operational resilience.
